

**1.**

Answers will vary.

**2.**

Warmer temperatures allow disease-causing organisms to survive in more areas of the world.

**3.**

Higher air temperatures can cause a higher concentration of ozone gas near Earth's surface.

**4.**

Example answer for the Tundra: The permafrost is melting sooner in the winter and some places are not freezing solid anymore.

**5.**

Example answer for grassland becoming a desert: Warmer temperatures could cause more evaporation. This could lead to the soil drying out and blowing away.
